

CSSE 230 Logger Setup Steps

1. Project properties setup

- Go to properties, and add these to the build path
- Add libraries
 - JUnit 5 should be under Classpath
- Add JAR dependencies: **Logger JAR Files**
 - Drag all into the Project Explorer under the project and select Copy files
 - Add JARs to Classpath

- Will look something like this:

- The Java version should be 15+
2. Adding the testSupport package
- Create empty folder called testSupport under src
 - If there's a pre-existing one, delete it and recreate
 - Drag over files from here into the folder:  testSupport
 - Finally, add this annotation to each test class:

```
@ExtendWith(LoggingExtension.class)
public class ArrayListMinPQTest {
```

 - Remove annotations and unused imports for BeforeLoggingExtension and AfterLoggingExtension, all three have been consolidated into one class
